

Support package for Calibri fonts

giovanni, le-tex publishing services

3rd March 2017

Introduction

The `Calibri` package provides an installation of the Calibri fonts (version 6.18) for LaTeX/NFSS. These fonts were designed by Luc(as) de Groot; copyright is: © 2016 Microsoft Corporation.

The Calibri comes in six subfamilies:

- Calibri Regular
- Calibri Italic
- Calibri Bold
- Calibri Bold Italic
- Calibri Light
- Calibri Light Italic

All these fonts have between 4514 and 6642 characters. Some of them are accessible with the `Calibri` package but far not all of them. Furthermore, the opentype fonts provide a lot of opentype features, first of all small capitals and a lot of figure variants. The most important features are accessible through the `Calibri` package.

The `README` file describes the installation of the package.

Package options and package loading

The `Calibri` package provides the following options to select the standard figure variant:

- `either lining or oldstyle` (default is `oldstyle`)
- `either tabular or proportional` (default is `proportional`)

Calibri does not load the packages `fontenc` or `textcomp` automatically. Please load these packages as required and with the required encoding options before loading Calibri. (See also the next section.)

Provided encodings and characters

The most important LaTeX output encodings are provided, except encodings for which the original fonts do not provide characters, e.g. the Armenian encodings OT6 and T6 and the math extension encoding OMX. It is important to note that not all encodings are complete and that it is up to the user to check that the character output is as intended.

Here is the list of provided output encodings:

OT1	(TeX text) is complete (only the stroke for † is missing; but U+142 is already part of the T1 encoding).
T1	(Cork) is complete.
TS1	(Cork companion) is not complete. Some (font specific) symbols are added.
LY1	(Y&Y) is complete.
QX	(polish) is not complete.
L7x	(lithuanian) is not complete.
OT2	(UW cyrillic) is not complete.
T2A	(cyrillic) is not complete.
T2B	(cyrillic) is not complete.
T2C	(cyrillic) is not complete.
X2	(cyrillic) is not complete.
T3	(IPA) is not complete.
TS3	(ipa symbol) is not complete.
T4	(african latin) is not complete.
T5	(vietnamese) is complete.
LGR	(greek 256, non-ASCII) is not complete.
U	(an extra encoding from the MinionPro package) is not complete.
OML	(TeX math italic) is not complete.
OMS	(TeX math symbol) is not complete.

Finally, note that many characters of the original opentype fonts are not made accessible by the Calibri package. If one wants to have these missing characters, it is recommended to employ the original opentype fonts (also part of this package) and to use the fontspec package (or similar technologies) under XeTeX or LuaTeX to access the opentype fonts directly.

The following pages show the above mentioned encodings:
